AUTHOR: Alekseyev, G. I.

TITLE: Neutralizing the effect of nonuniform motion of record carrier during FM and PWM recording

SOURCE: Ref. zh. Radiotekhnika i elektronika, Abs. 3B406

REF SOURCE: Tr. Vses. n.-i. in-ta magnitn. zapis i tekhnol. radioveschch. i televid., vyp. 3(13), 1965, 80-83

TOPIC TAGS: signal recording, signal distortion, signal modulation, FM

ABSTRACT: The effect of parasitic FM, generated by a nonuniform motion of the record carrier, on the reproduced signal during FM and PWM recording is studied. It is shown that these distortions can be neutralized by modulating the distorted signal by an error signal. [Translation of abstract] From author's summary

2073. Clinical picture and diagnosis of the microfocal necroses in the myocardium  
(Russian text) ALEKSEEV G. K. Moscow *Terap. Arkh.* 1959, 31/2 (60-68) Graphs 2  
Tables 1 Illus. 1

Reports of observations on 40 patients suffering from coronary insufficiency with the development of multiple microfocal necroses in the myocardium are given. In 16 of them the diagnosis was confirmed at autopsy. Multiple necroses in the myocardium showed various clinical manifestations: frequent and protracted anginal attacks, moderate pyrexia, reactive changes in the blood, changes in the terminal deflection of the ventricular complex, more rarely, attacks of cardiac asthma or short anginal pains. An essential role in the pathogenesis of multiple microfocal-myocardial necroses, which are found more often in the subendocardial zone and the papillary muscles of the left ventricle, belongs to the stenosing atherosclerosis of the coronary arteries. It is suggested that this form of coronary insufficiency be called subacute coronary insufficiency with microfocal necroses or 'forme fruste' of myocardial infarction. (XVIII, 6)

Neposredstvennoye prevrashcheniye razlichnykh vidov energii v elektricheskuyu  
i mekhanicheskuyu (Direct Conversion of Various Forms of Energy into  
Electric and Mechanical Power) Moscow, Gosenergoizdat, 1963. 335 p.  
8500 copies printed.

Ed. (Title page): K. P. Yakovlev, Doctor of Physical and Mathematical Sciences, Professor; Ed.: A. S. Meleyev; Tech. Ed.: G. Ye. Larionov.

PURPOSE: This book is intended for engineers and technical personnel interested in power engineering and power installations. It may also be useful to teachers and students in schools of higher education, and to scientific workers.

COVERAGE: The book describes the general principles and theories of direct conversion of chemical, nuclear, thermal, or solar energy into electrical or mechanical energy. Possible circuits for power installations are described, and current trends and prospects for further development in this field discussed.

AUTHORS: Alekseyev, G.V., Engineer,  
Zenkevich, B.A., Candidate of Technical Sciences,  
Subbotin, V.I., Doctor of Technical Sciences, Professor

TITLE: An investigation of heat transfer when water in tubes  
boils with bubble formation

PERIODICAL: Teploenergetika, no.4, 1962, 74-76

TEXT: Although a good deal of experimental data has been  
accumulated on heat exchange when water boils in tubes, there are  
considerable differences between the results of various authors  
and little work has been done on heat transfer at high steam  
contents. The present work was undertaken to fill the gap.  
The experimental section consisted of a pure nickel tube of  
12 mm o.d. with a wall thickness of 1.5 mm, electrically heated  
and with an effective length of 700 mm. The incoming water  
could be heated either to some definite temperature below the  
saturation temperature or to a given steam content. Tests were  
made with the pressure, the specific heat flow and the rate of  
flow of water (by weight) maintained constant, and the input heat

Card 1/3

S/096/62/000/004/001/001

An investigation of heat transfer ... E194/E455

content of the water was determined which gave a set value of steam content in the experimental section. Tests were made with boiling with bubble formation at pressures of 30, 60, 100 and 150 atm with flow rates of 250 to 2000 kg/m<sup>2</sup> sec, with specific heat flow rates up to  $0.6 \times 10^6$  kcal/m<sup>2</sup> hour and steam contents by weight up to 90%. The maximum error of determination of the steam content  $\alpha$  ranged from  $\pm 20\%$  at a pressure of 30 atm to  $\pm 50\%$  at a pressure of 150 atm. The error rises with increase in pressure, because at higher pressures the temperature drops are smaller and the possibilities of error are greater. Forced flow was used and it was found that neither the rate of circulation nor the initial value of the steam content had any influence on the process of heat transfer and, with well-developed surface boiling, the heat transfer coefficient was entirely determined by the specific heat flux and the pressure. The influence of pressure on the heat-transfer coefficient can be allowed for by a criterion  $K_p$ . The following empirical formula was derived for heat transfer to a steam/water mixture during boiling with bubble formation:

Card 2/3

S/096/62/000/004/001/001

An investigation of heat transfer ... E194/E455

$$\alpha = 0.1 K_p^{0.314} q^{0.7} \quad (4)$$

where

$$K_p = \frac{p \cdot 10^4}{\sqrt{\sigma(\gamma' - \gamma'')}} \quad (5)$$

$\alpha$  - the heat transfer coefficient;  $q$  - the absolute pressure,  $\text{kg/cm}^2$ ;  $\sigma$  - the surface tension,  $\text{kg/m}$ ;  $\gamma'$ ,  $\gamma''$  - the specific gravity of water and steam on the saturation line at the given pressure,  $\text{kg/m}^3$ . The maximum deviation of experimental points from this relationship does not exceed  $\pm 30\%$ . Results calculated by Eq.(4) are in good agreement with those found by other authors for the case of developed bubble type boiling in water initially below the saturation temperature. The relationship between the heat transfer coefficient and pressure and specific heat flow is of the same form for boiling with developed bubbling in tubes as in bulk boiling. There are 7 figures.

TITLE: Critical heat fluxes during forced flow of water

SOURCE: Teploenergetika, no. 3, 1965, 47-51

TOPIC TAGS: fluid flow, forced flow, flow analysis, external flow, internal flow

ABSTRACT: The authors examine experimental data on the boiling crisis during forced flow of underheated water and of a water-steam mixture in tubes. These data are compared with those on external flow around an isolated tube in a symmetric annular space, flow around a tube located along the axis of a square channel, and external longitudinal flow over bundles of tubes. Some of the data given in this paper are from previously published works by these authors. The results are given in a series of graphs. It is found that  $q_{cr}$  is inversely related to pressure for water flow within the tubes. The dependence on pressure is reduced when the mass velocity of

Card 1/2

L 65197-65  
ACCESSION NR: AP5006297

the water flow is increased. For flow within tubes,  $q_{cr}$  is inversely related to the enthalpy of the water in the crisis zone, the effect of enthalpy increasing with the rate of flow of the water. The complex relationship between  $q_{cr}$  and various combinations of parameters is discussed for external longitudinal flow. There is a theoretical difference between the cases of internal and external cooling with respect to the effect of flow parameters and secondary factors on  $q_{cr}$  in external flow. Care should be taken when generalizing experimental data not to depend on extrapolation into regions where there is no reliable empirical basis for this procedure, since experience has shown that  $q_{cr}$  is sometimes a complex function of the flow parameters and various secondary factors. Orig. art. has: 8 figures.

Several factors are important in formation flying. Formation leader must be well versed in instrument flying and aerial maneuvers, being able to adapt his plans to each situation. Training received by every pilot, which will permit him to maintain his place, is just as important. Every pilot should be able to judge altitude, distance, and interval. Describes basic factors involved in three requirements and discusses briefly ground training for pilots.

Orig Pub : Sb. stud. rabot Yaroslavsk. s.-kh. in-ta, 1956, No 1, 11-13.

Abst : In the collective farm "Sixth Soviet Convention" in the Kalinin district in the summer of 1955, experiments were conducted on sprinkling and pollination of winter wheat by fertilizers. For sprinkling 10 kg N<sub>aa</sub>, 9 kg P<sub>c</sub> and 1 kg K<sub>x</sub> per hectare were used; for pollination 50 kg Naa, 50 kg P<sub>c</sub> 10 kg K<sub>x</sub> per hectare. The pollination was conducted mornings when dew was present. Two sprinklings yielded a drop increase of 3.4, and two pollinations, 4.2 centners of grain per hectare.

TITLE: On the home development of television electrovacuum devices  
for broadcast and industrial television

PERIODICAL: Tekhnika kino i televideniya, no. 12, 1959, 1-11

TEXT: This article is a review of the development of television electric-vacuum devices in the USSR from the late 20's to 1959. The authors describe in chronological order all types of camera tubes, picture tubes and television projectors developed during this period and cite the names of 43 Soviet personalities, with references to their works, who participated in the development of Soviet television. Most research work was carried out in the Leningradskiy televizionnyy institut (Leningrad Institute of Television), the Zavod "Svetlana" ("Svetlana" Plant) and the Laboratoriya K.M. Yanchevskogo (K.M. Yanchevskiy Laboratory). All types of tubes developed and/or produced are tabulated. The following conclusions are drawn: The reviewed data indicate that a large assortment of television camera tubes

Card 1/2

On the home development ....

S/187/59/000/012/001/005

and picture tubes is now available for designing diverse television equipment. Nevertheless, it is necessary to improve the existing tubes, in particular to considerably increase the general and contrast sensitivity of camera tubes and the brilliancy and resolution of picture tubes. Another problem is to further decrease the inertia and to improve the picture background in vidicons. There are 5 figures, 4 tables and 36 references: 35 Soviet-bloc and 1 non-Soviet-bloc. The reference to the English-language publication reads as follows: P. Schagen and others, The "Scenioscope" a new television camera tube, Philips Technical Review, 17, No. 7-8, 1956.

TITLE: The Hallowness of Old Trees (Duplistost' starykh derev'yev)

PERIODICAL: Priroda, 1958, Nr 8, pp 94-95 (USSR)

ABSTRACT: An old forest near Voronezh with oaks 250 - 280 years old is known for the hollows in the trees. One third of the oaks have hollows. The trees grow mostly in flooded areas along the Vorona and Khopr rivers. The fungus causing the hollow is mostly Lactiporus sulphureus. The hollow is enlarged, however, by ants, birds, bees, etc. It is recommended that the formation of hollows be studied to protect valuable old trees.  
There are 3 photos.

TITLE: Variable-pitch propeller. Class 62, No. 184147

SOURCE: Izobret prom obraz tov zn, no. 15, 1966, 195

TOPIC TAGS: aircraft propeller, propeller blade, propeller pitch control, hydraulic  
drive, servomechanism, servosystem

ABSTRACT: An Author Certificate has been issued for a variable-pitch propeller consisting of a hub (with blades mobilely attached) and a cylinder containing a variable-pitch mechanism and a control unit. The propeller is equipped with a hydraulic control unit, connected with the aircraft's hydraulic system, for the automatic control of propeller pitch and the engine's gas while assuring constant rpm and a minimal fuel expenditure. The control unit includes main and emergency regulators with control valves and servomechanisms consisting of servopistons with racks and pinions connected by a flexible coupling, one with the propeller's variable-pitch mechanism and the other with the engine's fuel-supply system. In order to remotely control propeller pitch and simultaneously adjust the propeller pitch for thrust, it can be equipped with a servosystem consisting of a spring-supported control valve and a tracking bushing for changing the propeller's pitch. To assure the

AUTHOR: Alekseyev, I.M.

TITLE: The Dispersion of Pigments in Highly-Viscous Media

PERIODICAL: Khimicheskaya nauka i promyshlennost', 1959, Vol 4, Nr 3,  
pp 365-371 (USSR)

ABSTRACT: A high degree of grinding of pigments increases their brightness, water-proof properties, etc [Ref 1, 4, 8]. For high-quality printing dyes the optimum size of the particles should be  $0.5 \mu$  [Ref 5], for the dyeing of leather with nitrocellulose enamels  $0.5 - 1.0 \mu$  [Ref 7; 8]. Jet mills are used in the preparation of micro-ground pigments [Ref 11]. The dispersion of pigments results in the following processes: disaggregation of the pigment particles; wetting; equal distribution. The dispersion of white pigments in low-viscous media has been introduced in 1958 in the USSR in the Plant "Pobeda rabochikh". The dispersion, except in low-viscous media, is based on the application of shearing stress. For the treatment of nitrocellulose, friction rolls are used to avoid inflammation and explosion. Rolls of 100 cm can exert a pressure of 110 tons. The microphotoanalysis magnified 3,000 times shows the advantage of dispersion by friction rolls (Figure 1 - 8).

The Dispersion of Pigments in Highly-Viscous Media

SOV/63-4-3-13/31

Dispersion additions must be used for storing finely dispersed carbon black, otherwise the coatings will be less bright, light-resistant, etc. These properties were tested by GIPI-4 in the ultraviolet light of a mercury-quartz lamp of type PRK-2. Table 2 shows that the brightness is best maintained in enamels based on dry rolled pastes (SVP). The composition of chips is very different according to the purpose for which they are intended. The content of carbon black ranges from 6 - 20%, nitrocellulose 15 - 63.9%, dibutylphthalate 10 - 45%. They are prepared in mixers with Z-shaped blades. GIPI-4 has developed an "aqueous" method of production from an aqueous suspension of the components, i.e. without solvent [Ref 15, 19]. Nitrocellulose enamels produced from dry rolled pastes are used for coating small-capacity motorcars. The service time of these enamels is 1.5 - 2 times longer than that of the older types. Pigments of all types may be used in these enamels. A technology for producing dry rolled pastes based on perchlorovinyl resins, polyvinylbutyral, the resins EMK-5 and AS has been developed.
